

AYOKUNLE SAMUEL ADENIGBA

Data Analytics Professional

Rathenastr. 11, 16761 Hennigsdorf (Bei Berlin), Deutschland | +49 178 185 4390

[email](#) | [linkedin](#) | [my-portfolio-website](#)

PROFILE

I bring a combination of analytical depth, systems thinking, and commercial awareness, to support growth initiatives, improve performance, and reduce inefficiencies. I am experienced at translating complex operations and business requirements into modular, structured, and scalable analytics models on cloud platforms. I am skilled at developing end-to-end data solutions in telemetry (sensors and metering devices) and business domains. Implementing and automating descriptive and predictive/machine learning workflows to characterize systems and guide operational initiatives.

At ibvogt GmbH, I was responsible for analytics engineering, implementing centralized, traceable and efficient processes for teams and assessment of product (sites) performance. Working effectively with stakeholders across management and operations to align data solutions with business priorities. Earlier I worked as a system modeler and technical sales engineer for solar PV and battery systems. I have a permanent residence in Germany and a vehicle driver's license (class B).

CORE SKILLS

Automation & Solution Development

- Python, dbt, Databricks, SQL server management studio
- Azure, Fabric, Airflow, Power Automate
- Low-code business applications (Power Apps)
- CI/CD, Azure Devops, Git, Github, Governance- Unity Catalog, ACL

Analysis for Decision Support

- KPI design linked to business and financial outcomes
- Funnel and performance analysis
- Forecasting, classification, regression

Data Engineering & Modeling

- SQL (SQL Server, PostgreSQL, Snowflake)
- Lakehouse & warehouse modeling
- Incremental data processing. Data quality checks and validation

Visualization & Communication

- Power BI (DAX, Power Query, paginated reports), executive-level dashboards
- Stakeholder workshops & training

Renewable Energy

- SCADA system and site layout interpretation, validation, data quality checks
- Solar & BESS System modeling and analysis (PVsyst, PVsol)

Data Analytics Engineer — ib vogt GmbH

Berlin, Germany | Jul 2022 – May 2025

(Full-time)

I developed an end-to-end (ELT) analytics solution with Azure Delta Lake, databricks, dbt and Power BI. Applied the Lakehouse medallion architecture that enabled automated delivery of cleaned and validated data products from operational solar power generation sites. Accelerating the delivery of financially linked contractual reports and enabling commissioning engineers, project and asset managers to have auditable assessment, root-cause and predictive analysis of sites.

- This solution applies triggered incremental ingestion in databricks, extraction of contractual clauses, performance targets and thresholds from documents with OpenAI model API, transforming them into machine readable JSON format. The cleaning(silver) data layer implements data quality validation, normalization, and enrichment with IEC standard signal naming conventions.
- The KPI (gold) layer translates IEC 61724 standards and business logic into SQL code, CTEs and multi-source joins, to serve downstream Power BI dashboards.
- Unity Catalog for data governance.
- Reproducible methods (Bicep Infrastructure as code, dbt tests for validation, Azure DevOps for Continuous Integration)

I implemented a low-code end-to-end data solution with user-facing applications (Power App), Power Automate, Dataverse, and SQL server (SSMS) to streamline the process of acquiring and analyzing meteorological data. This resulted in a ~50%-time reduction for data requests, processing, and validation. This involved

- Creating validation logic to limit errors and costly redundant requests.
- Automating the HTTP requests to third party APIs, processing JSON|XML|CSV data, and initiating stored SQL procedures to load the transformed data into SQL server database tables, while sending status notification to the user.

I designed and deployed a Power BI model and dashboard for resource planning based on the Technical Complexity of proposed engineering work.

Data Analyst — ib vogt GmbH

Berlin, Germany | Sep 2020 – Jun 2022

(part time -> MSc. research)

Collaboratively developed Python ETL tools and modules for the analysis of timeseries, telemetry data and infrastructure. This entailed:

- Extending the extract, transformation functions to analyze and report on newly commissioned solar projects.
- Translating optimization questions, contracts and business rules into statistical models and decision logics in Python functions and delivering results to stakeholders.
- Implementing supervised learning algorithms and curve fitting (SciPy, sklearn..) to predict and quantify energy losses/gains and inform decisions on optimization and site maintenance operations.

- Applying explorative data analysis techniques to identify configuration-driven performance variations and make energy loss classification on real plant telemetry data.
- Developing fault detection rules in Python for inverters, strings and tracker level signals, which mitigated the losses and support operational planning.
- Collaborative software development approach using Git and Github.

System Engineer — Nexgen Energy

Dec 2016 - Aug 2019

(Full-time)

- Modeled and designed solar PV + battery systems for residential and commercial clients.
- Site assessment visits for system design, post installation maintenance and management.
- Analysis of Lithium and VRLA Batteries in relation to throughput & cycle counting, RTE, SoC/SoH. Tracking and warranty window compliance in relation to OEM guarantees.
- Tripled conversion rate and increased sales by standardizing solutions offerings across customer clusters. Over 300 customer and client engagements, communicating expected system energy production (yield) and product delivery.
- Managed distributors and resellers onboarding process, communication and issue resolutions.

EDUCATION

Technical University Berlin — MSc., Global Production Engineering

-MSc. Thesis Topic: Characterization of the Maximum PowerPoint Tracker(s) operation in string inverters with unequal distribution of PV array across the MPPT channels.

Covenant University — B.Eng., Electrical & Electronics Engineering

Internship - 6-month training at a 2*150MVA, 330/132/33 kV power transmission station. Focus: System control and operations, transmission lines and station switchgears maintenance.

PROFESSIONAL TRAINING AND CERTIFICATION

- Microsoft — Certified Power Platform Consultant
- Microsoft — Fabric Analytics Engineer
- Datacamp — Data Engineer (python, Airflow, SQL, dbt)
- Hash Analytics/Udemy — Python data analyst - Business Intelligence Analyst
- Technical University Berlin — Quality Management -Green Belt
- Technical University DelftX— Digitalization of Intelligent & Integrated Energy Systems
- Engineering Institute of Technology — Big Data Analytics in Electricity Grid (EIT)
- FSR European University Institute — European Electricity Market, Power Sector Regulation
- Renewable Academy Berlin — Solar PV Professional

LANGUAGES — English, German.
